The F Distribution The F distribution is an asymmetric distribution that has a minimum value of 0, but no maximum value. The curve reaches a peak not far to the right of 0, and then gradually approaches the horizontal axis the larger the F value is. The F distribution approaches, but never quite touches the horizontal axis.

On the other side of $f(n)$, it is convenient to define $\Theta()$ and $\theta()$ that provide tight and loose lower bounds on the growth of $f(n)$. $\Theta()$ (Big-Omega) is the tight lower bound notation, and $\theta()$ (little-omega) is the loose lower bound notation.

The F distribution is a right-skewed distribution used most commonly in Analysis of Variance. When referencing the F distribution, the numerator degrees of freedom are always given first, as switching the order of degrees of freedom changes the distribution (e.g., $F(10,12)$ does not equal $F(12,10)$).

Table of critical values for the F distribution (for use with ANOVA): How to use this table: There are two tables here. The first one gives critical values of F at the $p = 0.05$ level of significance. The second table gives critical values of F at the $p = 0.01$ level of significance. 1. Obtain your F-ratio.

2 The F-test We have seen our t-statistic follows a t distribution with a "degrees of freedom" parameter. This fact has been useful for hypothesis testing, both of sample means and of regression coefficients.
